機台結構 MACHINE STRUCTURE

A 入胚系統 Preform Infeed System

C 加熱系統 Heating System

E 出瓶系統 Bottle Discharge System

D 成型系統 Molding System

A 入胚系統 Preform Infeed System

- 輸送帶將瓶胚從料桶至整列機，再將瓶胚自動排列成序後單道送胚。
- 採用伺服馬達驅動分胚載塊作動及定位。
- 入胚夾爪將瓶胚取至公轉滑塊上。
- The conveyor delivers preforms from hopper to unscrambler, then preforms are automatically arranged in order, ready for feeding.
- Movement and locating of preform dividing block is driven by servo motor.
- Preform in-feed gripper picks preforms and place them on the transfer system.

B 公轉系統 Transfer System

- 採用伺服控制的螺桿驅動，動作快速穩定及衛生環保。
- 有別於傳統噪音較大的直線機公轉採用鏈條傳動或氣缸驅動，我們的噪音較小。
- Screw movement is controlled by servo motor, provides fast and smooth motion, thus it is environmental-friendly. As distinguished from the conventional loud and noisy linear transfer system, which normally uses chain or air cylinder, ours is quieter.

C 加熱系統 Heating System

- 瓶胚以併排橫列之矩陣模式送入加熱單元。
- 單邊燈管雙邊加熱與反射聚熱模式，確保瓶胚受熱均勻。
- 模組化設計，提昇紅外線燈管及冷卻水道維修保養便利性。
- 瓶胚出加熱箱後，配置溫度感應開關，顯示瓶胚溫度，利於加熱功率調整。
- The preforms are fed into the heating system in a parallel horizontal matrix mode.
- Double side single accommodation heating zone and reflect heat concentration concept make preform more evenly heat.
- Module design enhance maintenance of IR lamp and cooling ramp.
- Preforms leaving heating system, by going through the thermocouple device, which detects the temperature of the preforms and adjusts the heating power efficiently.

D 成型系統 Molding System

- 鎖模機構採用伺服馬達配合凸輪驅動。
- 公轉滑塊將加熱後的瓶胚送至模具中吹瓶成型。
- 吹瓶後的高壓氣體回收，到儲氣罐，供增壓機或低壓系統使用。
- The clamping mechanism is driven by a combination of servo motor and cam.
- The transfer system delivers the heated preforms to the mold for blowing bottle process.
- The high-pressure air exhausted after blowing is recovered to air storage tank, which can be reused as air booster in low-pressure situation.

E 出瓶系統 Bottle Discharge System

- 出瓶處加裝出瓶銜接機構，可與風送道連結，將成行瓶直接輸送至灌裝系統。
- The bottle discharge system can be equipped with air conveyor, which allows bottles to be directly fed to the filling system.
